

## Instructions for Making Custom Masks

► N.B. PD's standard masks are 720x540 (4:3), but they can be any size you want. The masks in the **PDtoots** set are 1920x1080 (16:9)

1. Open a new document in Paint.NET, PhotoShop, GIMP or whatever you're using. It must be software that supports transparency.
2. Draw a black and white image... the black being the bit that masks the image so you see through it. The white section is where the masked video/image will appear.

3. Make the black section transparent

4. Save it as a .png file, using the correct naming protocol – e.g. "123xyz.png"
5. Save as "123xyzThumb.png" - then resize that to **80x60** (important!)

N.B. So that the thumbnail appears correctly in PD's interface, make the transparent section black again.
