

Hi,

This is a graphical representation of what I am trying to achieve, I have created an "First Play" video using my own project files and saving as a WMV file then incorporating that in my 'Create Disc' menu, but what I am after is to save to Director Zone as a template. But when I do, then download (my upload) and install it then use in a new project my original video is still within the colored square areas? Can some one help?

This is to explain what I am trying to achieve for a PowerDirector11 Ultimate, so bare with me. The image here is a simulation, not the finished design.

The film strip will when I get things closer to finished stage will contain image

The concept to the right is the part I am having problems implementing in an first 'Play video'. When I try to modify a default template that contains my thoughts it doesn't allow me.

What I am after is the partial film strip to the right (with the shadow) I want the three colored shapes to contain a video that would pertain to the 'users' project, then after a set duration the 'Disc Menu' is displayed.

I have an understanding (not in depth) of PiP objects and general concepts of disk creating with chapters/menus etc., Just I can't get my brain to figure out how those Intro videos are created, when I open a default template going straight to 'Disc create" module there is an 'image' of a cyclist in black and white. If I replace my colored shapes with that same image will that be replaced by a project video?

Movie Title
